Track: Book-Applied

Chapter 4: Applied: Kubernetes Deployment for Java Services [Advanced]

Chapter focus: Kubernetes Deployment for Java Services** *(Level: Advanced)

Kubernetes schedules pods across nodes with declarative Deployments and Services. Probes (liveness, readiness, startup) integrate with Spring Actuator health endpoints. Resource requests/limits prevent noisy neighbors and enable autoscaling. Ingress controllers terminate TLS and route hostnames to backend services.

Code Reference:

```
livenessProbe:
  httpGet:
    path: /actuator/health/liveness
    port: 8080
  initialDelaySeconds: 30
```

```
readinessProbe:
  httpGet:
    path: /actuator/health/readiness
    port: 8080
```

What it shows: Liveness restarts unhealthy pods; readiness removes pods from load balancing until ready.

Topic guide

What it actually is

Kubernetes orchestrates containerized workloads with self-healing and horizontal scaling.

When to use it

Use when running multiple Java microservices that need automated rollout and scaling.

Where to use it

Cloud-native production environments on AWS EKS, GKE, Azure AKS, or on-prem clusters.

Real use example

Black Friday traffic triggers HPA to scale order-service from 3 to 30 pods automatically.

Chapter 5: Applied: Event-Driven Architecture with Kafka [Advanced]

Chapter focus: Event-Driven Architecture with Kafka** *(Level: Advanced)

Events capture facts that happened (OrderPlaced) rather than commands (CreateOrder). Kafka provides durable, partitioned logs with consumer groups for parallel processing. Idempotent consumers and exactly-once semantics require careful offset and key design. Schema Registry enforces Avro/JSON schema evolution across producer and consumer teams.

Code Reference:

```
@KafkaListener(topics = "orders", groupId = "inventory-service")
public void onOrderPlaced(OrderPlacedEvent event) {
    inventoryService.reserve(event.orderId(), event.lines());
}
```

What it shows: Listener consumes order events; groupId ensures each message processed once per consumer group.

Topic guide

What it actually is

Event-driven systems decouple services through asynchronous, durable message streams.

When to use it

Use when workflows span teams, require replay, or tolerate eventual consistency.

Where to use it

Order fulfillment, notification pipelines, audit logs, and CDC-driven integrations.

Real use example

Inventory service replays last week's events to rebuild stock state after a bug fix.

Chapter 6: Applied: Distributed Tracing and Observability [Advanced]**Chapter focus: Distributed Tracing and Observability** *(Level: Advanced)**

Micrometer exports metrics; OpenTelemetry traces requests across service boundaries. Trace context propagates via W3C traceparent headers on outbound HTTP and Kafka messages. Structured JSON logs with traceId tie together metrics, traces, and log lines in Grafana. SLO dashboards alert on error rate and latency percentiles before users notice outages.

Code Reference:

```
management:
  tracing:
    sampling:
      probability: 1.0
  otel:
    tracing:
      endpoint: http://tempo:4318/v1/traces
```

What it shows: 100% trace sampling in dev; OTLP exporter sends spans to Tempo backend.

Topic guide**What it actually is**

Observability combines metrics, logs, and traces for production system understanding.

When to use it

Instrument every microservice before production; define SLOs for critical user journeys.

Where to use it

On-call runbooks, capacity planning, and post-incident reviews.

Real use example

An engineer traces a 502 error through gateway ? auth ? orders in Jaeger within two minutes.

Track: Book-Plan

Chapter 7: Study Plan and Practice [Advanced]**Chapter focus: Study Plan and Practice** *(Level: Advanced)**

Finish Cloud Native Spring in Action with a weekly plan: read one section, write a summary, complete one exercise, and reflect on how it applies to Java Backend Developer. If a free edition exists, practice every example. Submit your notes and one mini-project demo for teacher review.

Code Reference:

Week 1: Read + notes
Week 2: Exercises
Week 3: Mini project
Week 4: Review + quiz

What it shows: A 4-week plan turns reading into demonstrable skill.

Topic guide

What it actually is

Structured study plans improve retention and portfolio outcomes.

When to use it

After finishing the key topics chapters.

Where to use it

CodeQuest end-of-unit assessments.

Real use example

A learner completes the study plan and uploads a advanced project screenshot.
