Chapter 4: Applied: CMDB and Configuration Items [Intermediate]

Chapter focus: CMDB and Configuration Items** *(Level: Intermediate)

The CMDB stores Configuration Items (CIs)-servers, databases, applications-with attributes and relationships. Accurate CI data powers change impact analysis and incident assignment. Identification rules reconcile duplicates; baselines track drift. Avoid garbage-in by governing manual CI creation.

Code Reference:

```
var rel = new GlideRecord('cmdb_rel_ci');
rel.addQuery('parent', serverSysId);
rel.query();
while (rel.next()) {
    gs.info('Depends on: ' + rel.child.name);
}
```

```
}
```

What it shows: Relationship queries reveal downstream CIs before server patching.

Topic guide

What it actually is

CMDB is the technical inventory graph underpinning IT operations.

When to use it

Change planning, outage communication, and root cause mapping.

Where to use it

Data centers, hybrid cloud estates, and application portfolios.

Real use example

Planned DB maintenance queries CMDB to notify all apps depending on SQL-PROD-03.

Chapter 5: Applied: Flow Designer vs Workflow Editor [Intermediate]

Chapter focus: Flow Designer vs Workflow Editor** *(Level: Intermediate)

Flow Designer is the modern, low-code automation tool with triggers, conditions, and actions across tables. Legacy Workflow Editor still exists on older instances-know both. Flows can call subflows, ask for approval, invoke scripts, and integrate via spokes. Test in subprod with rollback plans before production promotion.

Code Reference:

```
// Flow trigger: Record Created on incident  
// Action: If priority == 1 -> Send Email + Create Major Incident task
```

What it shows: Declarative flows replace hundreds of lines of custom workflow code.

Topic guide

What it actually is

Flow Designer automates multi-step business processes with observability.

When to use it

SLA breaches, approvals, notifications, and cross-table updates.

Where to use it

HR onboarding, access provisioning, and major incident orchestration.

Real use example

New-hire flow creates AD request, hardware catalog item, and Slack notification automatically.

Chapter 6: Applied: GlideRecord Server-Side Scripting [Intermediate]

Chapter focus: GlideRecord Server-Side Scripting** *(Level: Intermediate)

GlideRecord is the primary API for querying and mutating records server-side. Use addQuery, setLimit, chooseFields, and getValue/setValue. Avoid GlideRecord in client scripts-use GlideAjax instead. Performance matters: nested loops on large tables cause transaction timeouts.

Code Reference:

```
var gr = new GlideRecord('incident');
gr.addEncodedQuery('active=true^priorityIN1,2');
gr.orderBy('opened_at');
gr.setLimit(100);
gr.query();
```

What it shows: Encoded queries mirror list filter syntax for maintainable scripts.

Topic guide

What it actually is

GlideRecord is the server-side database access layer.

When to use it

Business rules, scheduled jobs, script includes, and fix scripts.

Where to use it

Any automation touching multiple records or complex conditions.

Real use example

Scheduled job reopens stale P2 incidents lacking updates after 48 hours for manager review.

Track: Book-Plan

Chapter 7: Study Plan and Practice [Intermediate]

Chapter focus: Study Plan and Practice** *(Level: Intermediate)

If a free edition exists, practice every example. Submit your notes and one mini-project demo for teacher review.

Code Reference:

```
Week 1: Read + notes
Week 2: Exercises
Week 3: Mini project
Week 4: Review + quiz
```

What it shows: A 4-week plan turns reading into demonstrable skill.

Topic guide

What it actually is

Structured study plans improve retention and portfolio outcomes.

When to use it

Where to use it

CodeQuest end-of-unit assessments.

Real use example
